Orthodontics and Dentofacial Orthopedics James A. McNamara 2001 The initial eight chapters provide a synthesis of the wide variety of treatments currently available for malocclusions in the sagittal, transverse, and vertical dimensions. The subsequent chapters describe the details of clinical management of fixed appliance therapy (e.g., bracket placement and design - including self-ligating brackets, orthodontic bonding, archwire sequencing, transpalatal arch and utility arch management). Dentofacial orthopedics, including rapid maxillary expansion and extraoral traction, as well as functional jaw orthopedics (Herbst, Twin Block, FR-2 of Fränkel, Bionator) and molar distalizing appliances (Pendulum, Distal Jet, Wilson distalizing arch) then are considered. The management of Class III malocclusion with the orthopedic facial mask, the chin cup and the FR-3 of Fränkel also are discussed in detail. The book also includes two extensive chapters on interdisciplinary treatment written by Vincent G. Kokich, as well as chapters on finishing and retention protocols. The clinical and cephalometric evaluation of the orthodontic patient and the relationship of orthodontic treatment, occlusion, and temporomandibular disorders also are presented. Human Growth F. Falkner 2013-06-29 Growth, as we conceive it, is the study of changeinan organism not yet mature. Differential growth creates form: external form through growth rates which vary from one part of the body to another and one tissue to another; and internal form through the series of time-entrained events which build up in each cell the special ized complexity of its particular function. We make no distinction, then, between growth and development, and if we have not included accounts of differentiation it is simply because we had to draw a quite arbitrary line somewhere. It is only rather recently that those involved in pediatrics and child health have come to realize that growth is the basic science peculiar to their art. It is a science which uses and incorporates the traditional disciplines of anatomy, physiology, biophysics, biochemistry, and biology. It is indeed a part of biology, and the study of human growth is a part of the curriculum of the rejuvenated science of Human Biology. What growth is not is a series of charts of height and weight. Growth standards are useful and necessary, and their construction is by no means void of intellectual challenge. They are a basic instrument in pediatric epidemiology. But they do not appear in this book, any more than clinical accounts of growth disorders. This appears to be the first large handbook-in three volumes-devoted to Human Growth.
